The team at osu! breaks down their Android port. From the foundations to its visual look, and everything in between. For the last few years, our platform is Android. And while it is a great platform with many uses and great apps, it lacks a certain feature that apps like osu! (or other similar games) want access to. Apps like osu! and others need certain features present on the screen, especially things like achievements and leaderboards. So, what does osu! do to make sure this is possible on Android? There is a lot of stuff going on to make this happen, but to summarize, we have 3 main components to doing this. First is our app framework. This is the layer that essentially turns your Android device into a terminal for your game. The framework allows Android to do things like expand to fit the screen and taking screenshots in a way that it looks and works great. This is the foundation of our game for the past 2 years, and we continue to improve it every few weeks. We release the framework to our many users, and it helps guide our development for the next few years. It is a platform that has been proven and made sure to work well with osu!. Second is our graphics toolkit. This is for us to make our game looks great when it is running on Android. It is heavily based on OpenGL ES 2.0 and SDL, and it works very well with it. We have modified these for the many ways that Android can modify them, and we give a huge amount of flexibility to our graphics. Third is the custom framework we have. When building our game from our base, we use a certain framework. What this is is up to you to decide, and it is based around Unity and Mono. In Unity, you tell it what to build, and you give it what you need. This allows us to use a far more fast and easy approach to development. Mono allows us to use .NET, the framework we use is based on. It is at the top of the stack, so it is always running and is as close to the actual system as possible. In conclusion, we cover a lot of ground. From how to make the screen on Android expand, to how we make the game look, and even our game logic! We hope you enjoy it! Create a world where players can discover every item and solve every puzzle in a fair, fun game of brain-twisting make-better fun. Advanced Easy-to-read user interface, optimized to work with eyesight of "normal people". Game system OSU is a variation on a theme of games that also includes 2048. However, unlike the original 2048, OSU was built with an HTML-based, JavaScript-powered interface and a custom game engine that allows OSU to run on Windows, Mac, and Linux. The mechanics of the game are the same as 2048: one obtains bricks by clearing lines of block-shaped tiles. However, the number of brick types and arrangements is different, and although the game ends after four minutes if no tile is cleared, clearing one tile reveals new rules and tiles that are not accessible in the original 2048, making the game much longer. Furthermore, the game differs from many other 2048 games in that the number of lines in a row is not fixed, which means that some brick patterns may require a larger row than others. Game types Reasons to play The game requires a large amount of concentration as the combinations of tiles seen on the screen are almost always different from the tiles seen before. During every pass through the game, there is always a chance to be surprised by an instant win. Challenge settings The original 2048 had four difficulty settings ranging from easy to insane, and it was believed that there was not an ideal difficulty setting; however, OSU is gradually adjusting its difficulty settings to reduce the chance of "de-coupling" or losing interest (avoiding boring players) while also providing a satisfying, worthwhile challenge. The difficulty settings are: ?Easy: Passes with no instant wins. Starts at a 1,000 line high, and quickly decreases in lines. Counts all 20 tiles in each line as passed. Optimizes for large numbers of lines (approx. 20,000). ?Normal: Passes with no instant wins. Starts at a 10,000 line high, and quickly decreases in lines. Counts all 20 tiles in each line as passed. Optimizes for medium numbers of lines (approx. 30,000). ?Hard: Passes with no instant wins.
