torrentz.org [NEW].Q:

Better way to write this
function? I have a
function which I want to

use several times in my application, and have come up with a slightly long and messy way to write it. I was wondering if there was a more succinct way to write this. Here's the function:

Public Function

DoSomething() As String
Dim day As String day =
DateDiff("d", Now, CStr(

My.Settings.GetSetting(SettingsIdentifier.DateOfSchedule)) Dim week As
String week =
DateDiff("W", Now, CStr(My.Settings.GetSetting(SettingsIdentifier.DateOfSchedule))) Return day &
":" & week End Function

Any insight would be greatly appreciated. A:
The way to go about this

is to use functions and arguments passed to the function. Public Function DoSomething(schedule As String) As String
Return
DateDiff(Int(schedule), Now, CStr(My.Settings.GetSetting(SettingsIdentifier.DateOfSchedule)))
End Function Public Sub GetHours() Dim
