Disk drives are information storage devices that use magnetic media to store data. A typical disk drive includes a spindle motor that spins the disk or disks at a constant high speed, and an actuator that moves a transducer or head to specified locations over the disk. The disk includes a plurality of nominally concentric tracks, including data storage locations, and transitions between tracks that are defined by servo data written to the disk during manufacture and/or by formatting in association with the data stored in the data storage locations. Each servo data pattern corresponds to a respective servo sector, and each servo sector can be referenced within a servo data pattern by an index number. The index number is an integer number that is unique to a single servo data pattern. The index number corresponds to a number of tracks in the direction in which the pattern extends from the initial track to the final track (where the index number is a positive number). The index number indicates the data storage location of the data that has been written to a particular track or of the data that has been read from a particular track. Typically, servo data patterns are written with a low servo writing frequency. When the disk drive includes a plurality of disks in a substantially parallel relationship to one another, a single servo write transducer can be c6a93da74d
